

Ensures real-time guaranteed data exchange

Drives efficient and confident decision-making

Provides enterprise-class infrastructure for your organization

Remove the silos of disconnected information

The footprint of a process often extends outside the footprint of a single application. When managing the information related to a process or transaction in various, disconnected systems, they regularly become out of sync – making it very difficult to trust the data.

By deploying the OnBase Enterprise Integration Server (EIS), you connect all of those disparate systems so all information is updated simultaneously in real time. That way, employees no longer spend time manually double-checking and updating information in different applications – speeding processes and reducing errors and inaccurate decisions.

Create communication between disparate systems

OnBase EIS provides a real-time, guaranteed data exchange with your core systems and applications. As data changes throughout the day, the information managed within OnBase synchronizes real-time with the tasks and activities occurring in your other mission-critical applications.

This guaranteed data exchange is resilient to network disruptions and server connectivity – meaning that those involved in the process can have complete trust and confidence that the data is current, regardless of where they are accessing it. There is no time wasted verifying or second-guessing what they are looking at.

Efficiently make decisions based on accurate information

With OnBase EIS, users have instant access to all of the information they need, without having to leave their familiar core applications. OnBase intelligently links the related documents and data it manages to the information within the other core systems and makes it instantly available for the user on the same screen.

Without being forced to flip back-and-forth between various screens and systems, OnBase EIS saves users' time and enables them to focus on more mission-critical tasks, rather than manual data entry and corrections. And with all information updated simultaneously, employees can confidently and quickly make decision knowing they have the most up-to-date information.

Create an infrastructure that promotes continued success

With the ability to connect with any and all of your mission critical applications, OnBase EIS serves as an information hub between your organization's systems. Instead of relying on outdated, manual integration methods such as exchange of flat files, custom code or scripting, OnBase EIS offers a true enterprise-class integration, with the simple configuration you'd expect from OnBase. These integrations are also fully supported, maintained and upgraded along with the entire OnBase solution.

That way, as new processes arise and new solutions are deployed, you have the framework in place to bring them into the loop and connect them with your existing systems. So when choosing new applications, you can have confidence that their information will be available organization-wide after integrating with OnBase EIS – driving success and smart decisions in future IT investments.
